

Bugs

1.Sidebar Title Truncation Without Tooltip:

Issue: "Generate launch video storyboard" is truncated visually without providing a full title on hover or proper flexible layout space.

2.Sources Counter Discrepancy:

Issue: The message footer shows with two mini icons, but the header of the right side drawer lists

3.Unexplained Status Indicator (Red Dot):

Issue: Next to Notion AI in the right panel, there is a red dot indicator (Notion AI) with no tooltip, hover state, or legend explaining if it represents an error, offline status, or unread item.

4. Data Consistency & Labeling Bugs

- **Artifact Type Mismatch:** The top drawer header labels an artifact as CSV, while the badge inside the artifact container labels it as SHEET.
- **Sources Count Mismatch:** The message footer shows +2 Sources, but the right-side details drawer header displays Sources · 5 results.
- **Unclear Status Indicator:** Red status dots appear next to item names in lists without tooltips, legends, or text explaining what they indicate (e.g., error, unread, or offline).

5. Artifact & Component Preview Bugs

- **Static Skeleton Fallback:** Switching to the browser preview tab for a generated artifact shows generic wireframe placeholder blocks instead of rendering the actual generated page content.
- **Missing Code Snippet Prefix:** Exported React code snippets contain missing syntax characters (e.g., unction Usage Analytics Panel instead of function UsageAnalyticsPanel).
- **6.Dead-End Error Page:** The expired link page provides zero options to request a new link, verify email, or contact support.
- **URL Encoding Vulnerability:** Redirecting assignment links through external platforms (like LinkedIn) breaks the access token signature, causing valid links to be treated as invalid.

7. **Input Validation Bug**: Meaningless text strings display a green "valid" checkmark icon in the input container without performing actual string validation.

- **Incomplete Prompt Text**: Assistant instructions end abruptly mid-sentence without rendering the full prompt context.
- **Orphan Visual Elements**: Unattached indicator dots render randomly in the empty space between layout panes.

8. **Artifact & Right Panel Drawer**

1. **Broken Code Viewer**: The Code (4) tab displays filenames but does not expand or render actual code content.
2. **Static Skeleton Preview**: The Landing page preview tab shows generic gray boxes (Research, Create, Ship) instead of rendering the live generated landing page.
3. **Artifact Badge Mismatch**: Drawer header states CSV while the container badge inside states SHEET.
4. **Unexplained Red Status Dots**: Red indicator dots (•) render next to items without tooltips or legends.

8. **Content Clipping in Data Tables**: Table cells truncate string values mid-word (vis instead of visits, an instead of and) without ellipses.

- **Schema/Layout Mismatch**: Document subtitles reference columns (Motion notes, CTA timing) that are missing from the actual rendered table structure.
- **Icon-Type Mismatch**: Tab buttons labeled as App render generic document icons instead of application frame icons.

9. Authentication & System Flow Bugs

Dead-End Error Page: Expired token screens provide no options or buttons to request a new link or resend verification.

- **URL Redirect Encoding Corruption**: Routing links through external wrappers (such as LinkedIn redirects) breaks JWT/HMAC token signatures.
- **Missing Credit & Session Alerts**: The UI lacks a global credit balance tracker and fails to trigger warning alerts when session timer counts down below 5 minutes.

10.Border-Misaligned Indicator Dots: Warning/status indicators render directly overlapping container borders (e.g. top-right corner of the Desktop state preview card) without tooltip context or consistent application across viewport states.

11.Incomplete Timestamp Formatting: Search result cards display raw year numbers (2026) instead of full formatted timestamps or relative dates.

- **Missing Domain Favicons:** Website source cards fall back to plain letter placeholders instead of displaying actual website favicon images.
- **Nested Scrollbar Conflicts:** Dual vertical scrollbars render simultaneously in the artifact drawer, indicating improper CSS overflow bounds.

12.Static Hardcoded Component Templates: All browser artifact previews (Landing page preview, Product page angle) render the exact same hardcoded mockup template (Research, Create, Ship cards) rather than generating dynamic, topic-specific HTML preview structures.

13. Code vs UI Preview Discrepancy: Live component previews fail to render properties (metric deltas, full labels, activity charts) that are explicitly declared in the underlying React component file.

- **Navigation Router Binding Bug:** Internal links and hover states retain hardcoded route query parameters (?chat=chat-growth-launch-plan) from previous chats regardless of the currently active sidebar session.

14.Responsive Container Horizontal Overflow: Grid elements (e.g. 3-column metric cards) break out of the container boundary and get clipped horizontally on narrower panel widths without wrapping.

- **Sticky Input Overlap Bug:** The fixed message input box overlaps and obscures bottom-of-message metadata text (e.g. credit consumption counts).
- **15.App Preview Component Failure:** Every single App artifact type across the application (Admin analytics preview, Hero frame preview) fails to render live canvas Frames, falling back to empty grey placeholders for Desktop and Mobile viewports while incorrectly reporting a Ready status.

16.Landing page preview, main page and analytics preview failure and button is not working
